

Dowel hole locators

I like to hold cowls on with magnets but they must be located in position by dowels for which I use 4 or 5 mm nylon rod. The problem is getting the holes in each part (cowl and fuselage) located accurately. The answer is centre points as shown in the picture. Drill the holes in one part, insert the centre point and press the other part on.

This set is from 4 to 12 mm. There is only one of each so you will need at least two sets.
